SUMMARY

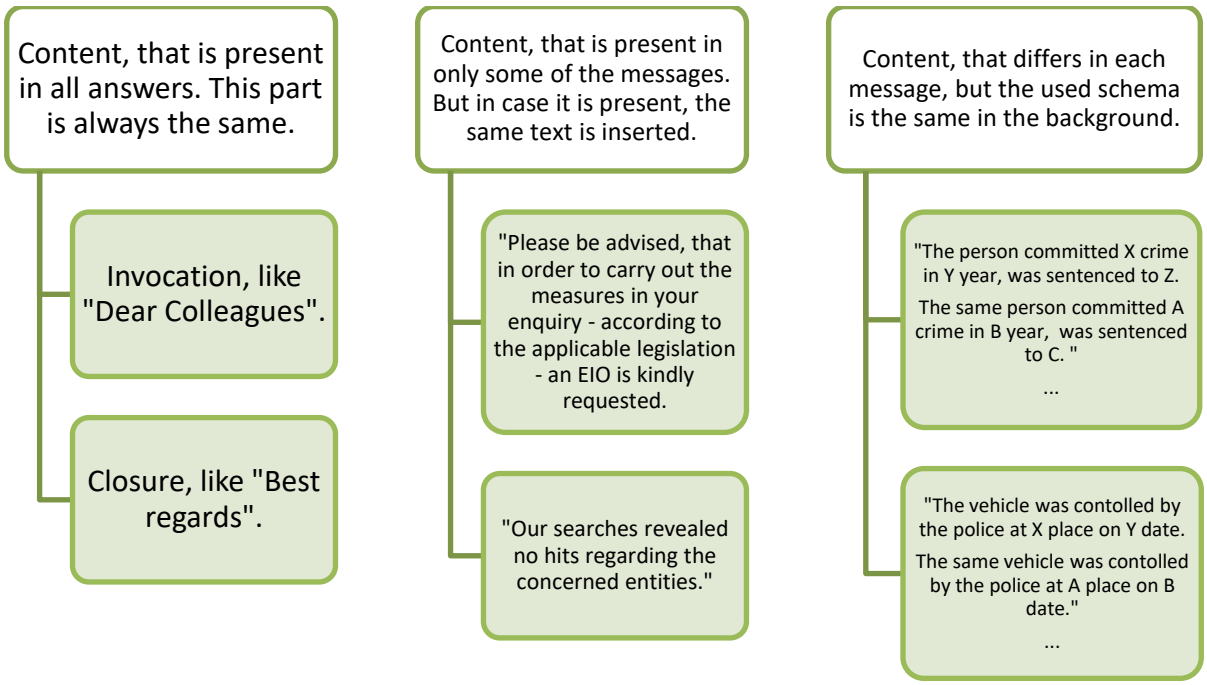

SIENA Constructor is a computer tool aiming to speed up and ease the creation of answer-messages within international criminal cooperation. The program utilizes the recognition that most answer messages are structured the same way using similar elements. With this tool, the user only needs to fill out the concrete, case-specific data and the Constructor composes the custom-tailored, but structurally unified answer of the inbound request.

The software itself is an offline HTML web page with forms to be filled out. SIENA Constructor does not save any data, it neither interacts with other applications nor generates any network or Internet traffic.

AIM OF THE TOOL

Elaborating and answering incoming requests within international criminal cooperation is a time-consuming activity. Although answer-messages are – just like requests – generally unique, most of them can be adapted to some kind of schema.

Three main categories of permanence can be spectated within the content of the answer-messages:

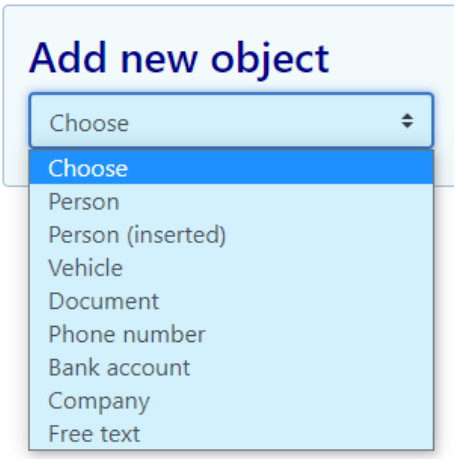

SIENA Constructor functions by the recognition of these permanent structures. The user can select and input the content that is case- and message-specific, but otherwise – using the known, programmed schemas – the tool adds all the structure and the pre-composed features to the message, therefore only the most necessary data needs to be typed in. Obviously, it is also enabled to add unique, free content to each message.

By using this program, you can send answer-messages in a structured format, avoid typos and save time.

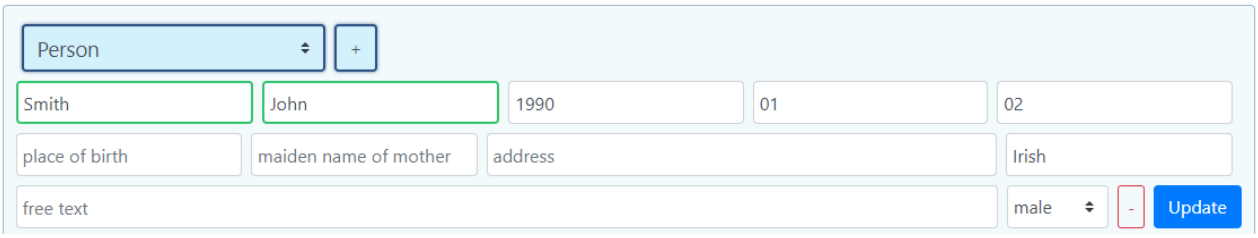

HOW TO USE

In order to be informed how to start the tool, please check “Technical specification” on the 15th page.

SIENA Constructor uses objects that the user can add and specify. These are the objects in question of the request, whose answer is created by the tool. There are seven main object categories that you can add using a dropdown menu:

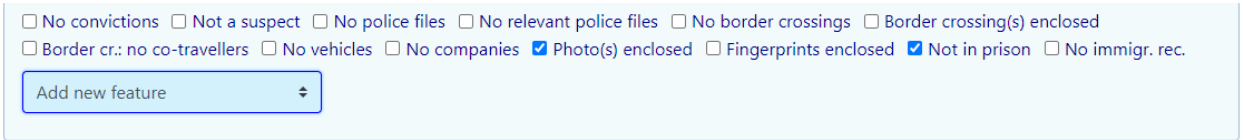

After selecting the type of the object, the tool displays the object-related fields of the form. In case of “Person” it is:

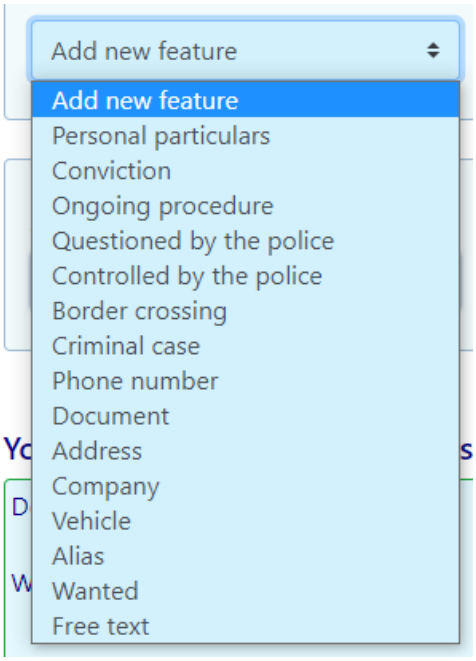

With these fields you identify the object of the request that is in question. **Therefore these fields are only to be filled out with the data that is already known also by the sender of the request.** The only exception is the “sex” field. By specifying this optional characteristic, it defines whether “he” or “she” will be used in the subsequent part of the generated message.

The fields with green outline should be filled out in order to let the message generated in a proper way. (In case those fields remain empty, no error occurs, but it might happen that some parts of the message will be tangled). After clicking on “Add” (or pressing the “Enter” button), a new set of fields appears, that is specified by the type of the chosen object:

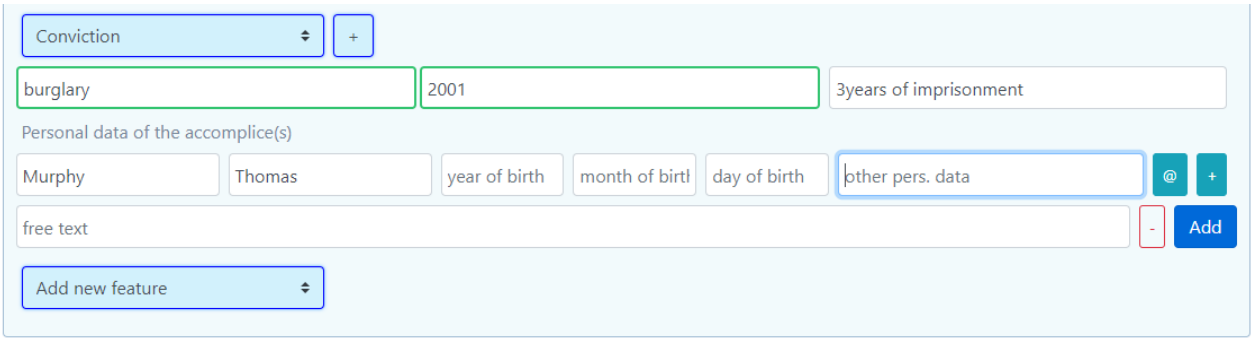

These fields (checkboxes + features) serve the purpose of creating the content of the answer related to the elaborated object. With the checkboxes you can add predetermined characteristics to the entity that appear in the generated message immediately after checking in the box.

With the “Add new feature” dropdown menu, object-specific features can be attached to the object in question. In the category of “Person”, the following features can be added:

After selecting the intended feature, a new, corresponding set of fields appear, in case of “Conviction”:

Using this concrete feature, the committed crime, the year of perpetration, the sentence, the personal data of the accomplice(s) (and free text) can be appended.

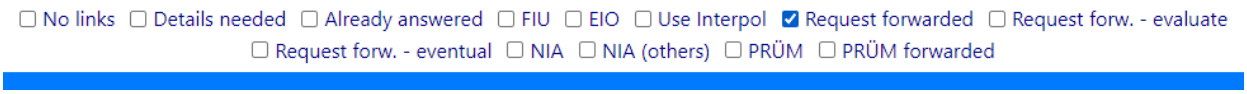

It might be needful to specify the emerged accomplice in the answer-message in detail. (For example: his/her photo, convictions, address, etc. might be also relevant.) In order to reach that without unnecessary typing, click on the “@” button on the right side and you can add the accomplice as a new “Person” object to the message. This “@”button (with the same functionality) appears also next to other fields, where the particulars of a person can be entered. With the “+” button you can add more (multiple) accomplices to the form. Just like the “@” button, the “+” button can also be found adjacently to other fields with the same purpose.

As it might be necessary to append custom text to each object and feature, this possibility is included in all set of fields.

By clicking on the red "-"button left to the "Add" button, the pertaining feature / object (and the related part of the generated message) can be removed (it functions both before and after adding the content of the object / feature to the message). This function can be found connected to all types of objects / all features.

It is possible to add the same feature to the given object multiple times (for example: more addresses of a person), and you can also add several different features to any object.

An other set of checkboxes can be found at the bottom of the page. This set is always present and universal, it is not related to any objects:

By selecting the proper checkbox you can add such pre-generated text to the message that is irrespective from the different objects, for example, by "Request forwarded": "*Please be informed that we've forwarded your request to the competent police unit in order to provide you with a detailed answer. Your enquiry will be replied as soon as possible.*" It is possible to tick in and off the checkboxes during the whole process of composing the message.

The message generated on the basis of the completed fields is updated continuously, after each data-intake (after entering new data and hitting "Enter" or clicking on the "Add" / "Update" button.) The current message can be found at the bottom of the page. In case of the data-intake presented above, the following message is generated:

You can copy the content to the clipboard by clicking on the "Copy" button at the bottom right corner, and after that the message can be inserted to SIENA (or any other platform) by the "Ctrl-V" hotkey.

Editing

There are more ways of modifying the message or the content of the completed fields:

- If you need to change the data entered into the fields / add new fields, it is always possible. After editing, simply press “Enter”, or click on the “Update” / “Add” button.
- The generated message is also editable as a general setting. Just click on the appropriate line and edit the content. After editing a section that was produced based on the completed data of the corresponding fields, the “Update” button next to the corresponding field will become red, in order to notify the user, that in case he or she manipulates the content of the field in the future, and clicks on the “Update” button, the manually edited content will lose (as the content will be re-generated again on the basis of the data within the completed fields).
- It is also possible to change the order of the elements of the generated message or freely mix them. You can do it by clicking on the “Final formatting” button at the bottom right corner. As this might mix up the structured elements it is advised to do it only when you finish composing the message.

OBJECTS AND FEATURES

The following objects, features and checkboxes can be added to each message (multiple times, if needed):

Person

Specific identifier(s):
- family name and
- given name.

Checkboxes:
No convictions
Not a suspect
No police files
No relevant police files
No border crossings
Border crossings enclosed
Border cr.: no co-travellers
No vehicles
No companies
Photo(s) enclosed
Fingerprints enclosed
Not in prison
No immigr. rec.

Features:
Personal particulars
Conviction
Ongoing procedure
Questioned by the police
Controlled by the police
Border crossing
Criminal case
Phone number
Documents
Address
Company
Vehicle
Alias
Wanted
Free text

Person (inserted)

By using this special option, it is possible to insert persons directly from SIENA (using clipboard).

If the persons are added to the SIENA message as structured content, select them (at the top of the SIENA-request) with your mouse and copy the selected content to the clipboard (right click on the selected content and choose "Copy"). It is possbile to select multiple lines (persons).

Afterwards, insert the selected content to the textbox in SIENA Constructor. If you do this, the persons will appear in the proper format (one person / one line). Don´t change the original format. Example: John SMITH, 12 April 1979.

By clicking on "Add", the inserted person(s) get appended as new objects. Before adding them to the message you can revise them singly.

Vehicle

Specific identifier(s):

- number plate.

Checkboxes:

Not in nat. db

No border crossings

Border crossings enc.

No police files

ANPR in progress

ANPR enclosed

ANPR negative

Features:

Border control

Owner

Controlled by the police

Free text

Document

Specific identifier(s):

- type: passport, ID card, driving license or residence permit.

Checkboxes:

Existing

Not existing

Features:

Issued to

Valid / issued on

Lost/stolen

Free text

Phone number	**Specific identifier(s):** - phone number. **Checkboxes:** Not in police database Subscriber in progress **Features:** Subscriber User Free text
Bank account	**Specific identifier(s):** - bank account number. **Checkboxes:** Not in police database EIO is requested Not in police db - EIO **Features:** In case Owner Free text
Company	**Specific identifier(s):** - company name. **Checkboxes:** Existing company No such company Company certificate enclosed No police files No relevant police files **Features:** Members Bank accounts In case Free text
Free text	You can add free text to the message by selecting this option.

EXAMPLE

In this example you've received a SIENA request in which you have been asked to check, whether a specific person (Udo SCHOTTE, DOB: 12/01/1977), who is the leader of an organised group committing cross-border motor vehicle crimes

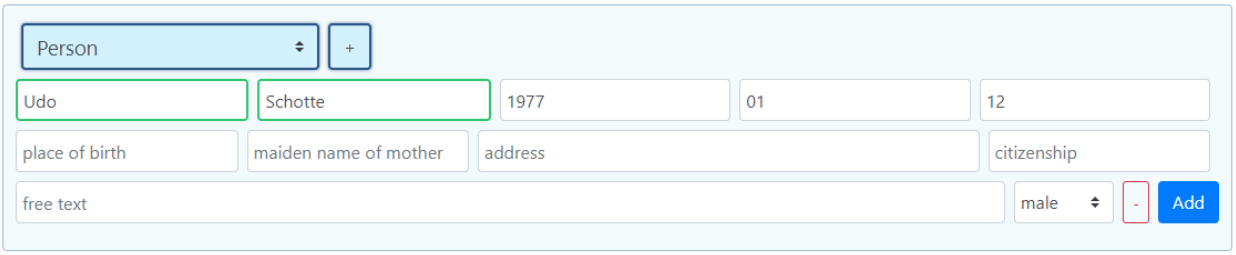

- has convictions in your country or is a suspect in ongoing cases,
- has been controlled by the police in your country (also the data of other persons controlled together with him is asked),
- and his photo is also requested.

It is also requested to check the border crossings and police files of a vehicle (l/p HA-GO-001) that is used by the criminal gang. Finally, the subscriber and the related police files of a phone number (0054872685045) that appeared on the crime scene is part of the enquiry, too.

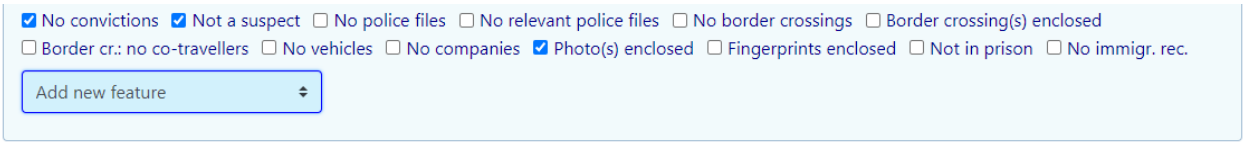

Please take note that this is a fully fictive example.

The process of creating the SIENA-answer:

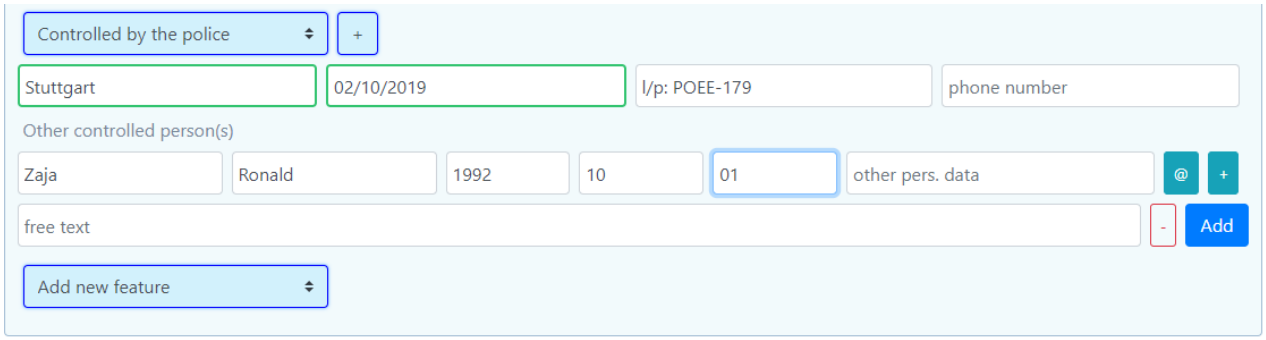

Person – inserting the known data.

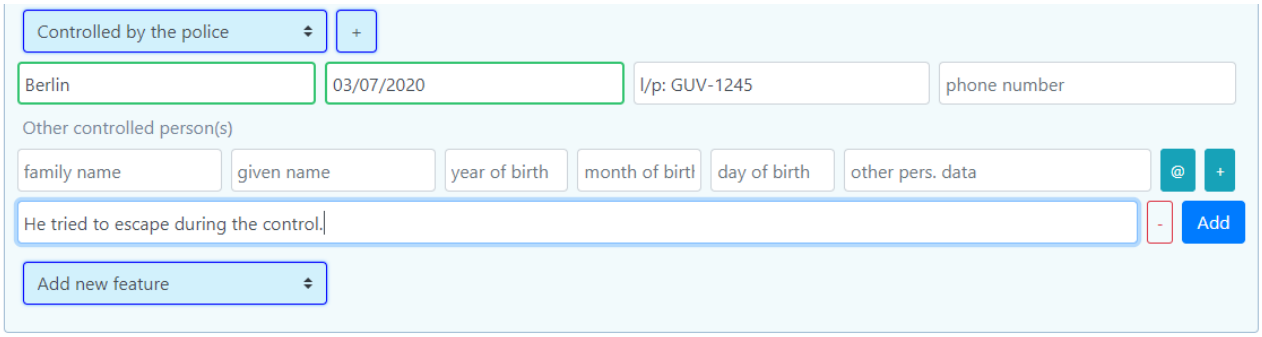

Person – ticking the proper checkboxes (he is neither a suspect nor has convictions, we have a photo available).

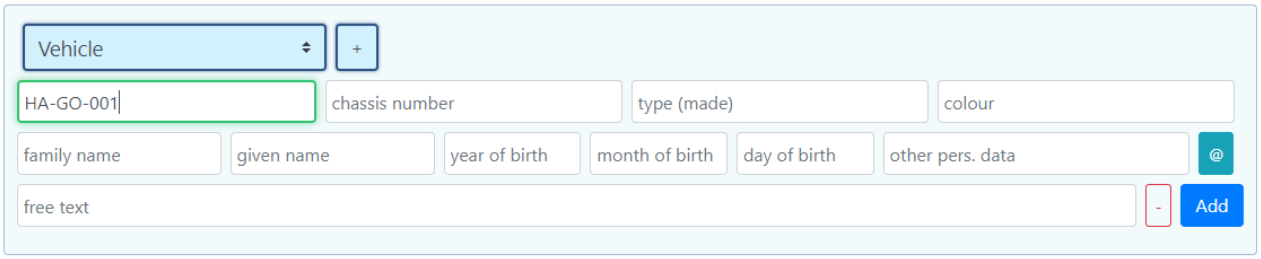

Person – entering the data of the police controls using the proper fields. (He was controlled two times, once together with an other person, license plates were recorded both times. During the second control, he tried to flee. As this might be important, we append this using the "free text" field).

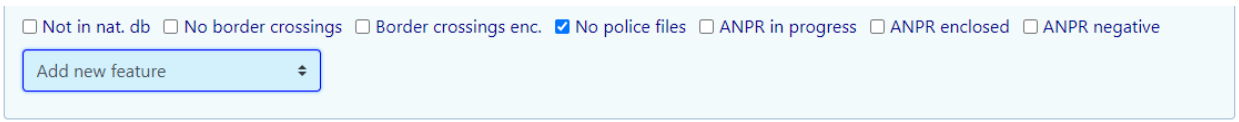

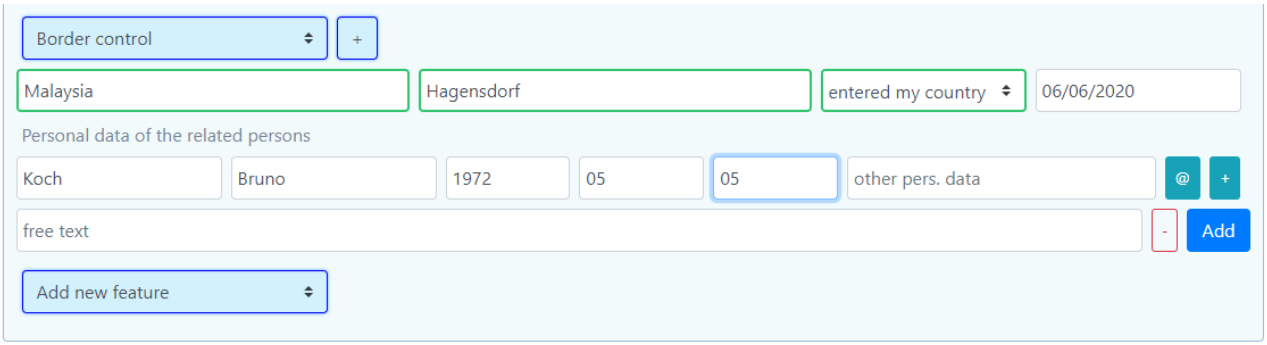

Vehicle – inserting the known data.

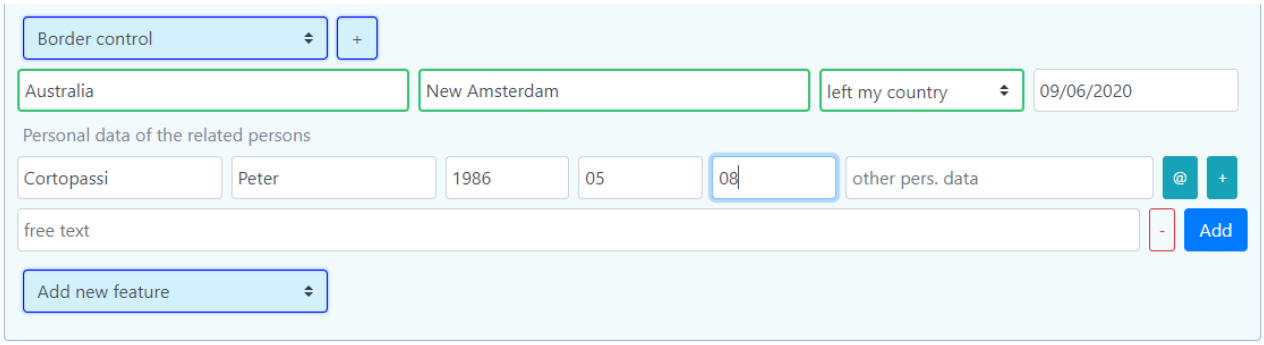

Vehicle – ticking the proper checkbox (it appears in no police case).

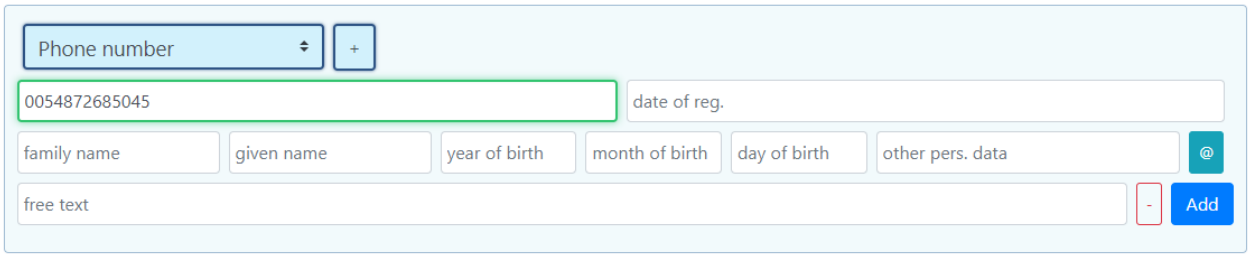

Vehicle – entering the data of the border crossings using the proper fields. (The vehicle was controlled twice, one passenger was registered both times.)

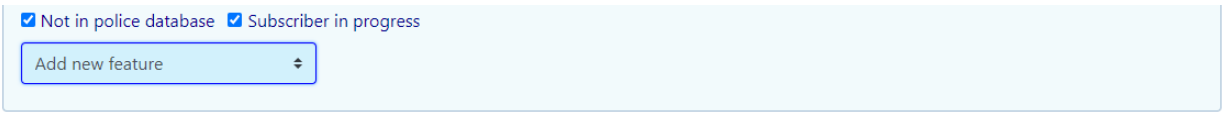

Phone number – inserting the known data.

Phone number – ticking the proper checkboxes (it is not present in the police database and we forwarded it to the competent unit in order to obtain the subscriber data).

The constructed message, that can be copied to the clipboard ("Copy" button) and inserted into SIENA ("Ctrl-V" hotkey).

Your custom-tailored SIENA message:

Dear Colleagues,

We hereby inform you,

Concerning UDO, Schotte, DOB: 12/01/1977:

Please find his photo(s) attached.
This individual is not a suspect in any ongoing criminal investigation.
This person has no convictions.
This person was controlled by the police:
- In Stuttgart on 02/10/2019. He used the vehicle: I/p: POEE-179. He was together with the following person(s) during the control: ZAJA Ronald (DOB: 01/10/1992).
- In Berlin on 03/07/2020. He used the vehicle: I/p: GUV-1245. He tried to escape during the control.

Regarding the vehicle with the number plate HA-GO-001:

This vehicle did not emerge in any police case in my country, it has no recorded police controls (within the requested period).
The registered border crossing(s) of this vehicle:
- Direction: entered my country, at Hagensdorf (border between my country and Malaysia). The crossing took place on 06/06/2020. Person(s) who used the vehicle: KOCH Bruno (DOB: 05/05/1972).
- Direction: left my country, at New Amsterdam (border between my country and Australia). The crossing took place on 09/06/2020.

Regarding the phone number 0054872685045:

Please be advised, that we forwarded your enquiry to the competent unit in order to determine the subscriber of the phone number from the provider. The result will be communicated to you asap.
This phone number cannot be found in my country's police databases.

Best regards

Final formatting Copy

TECHNICAL SPECIFICATION

As SIENA Constructor is an offline HTML-page, only a web browser is needed to use it. It was developed and tested for Google Chrome, therefore it is highly recommended to open it in this browser. It is advised to use the tool in or near full screen mode to avoid the congestion of the displayed fields.

In order to start the Constructor, copy the provided files to a common folder in your computer. This folder can be named anyhow and placed anywhere. Afterwards, you can start SIENA Constructor by opening the file “index.html” in your browser. An easy way of doing this is simply dragging and dropping the icon of “index.html” into the main area of the running Google Chrome. For further convenience it can be saved to the bookmarks.

Besides HTML (file: index.html), the tool utilizes the programming language Javascript and jQuery (files: js.js and jquery-3.5.1.min.js) which are responsible for the logic of the software. The visualization is elaborated by using CSS and Bootstrap (files: app.css, bootstrap.bundle.min.js, bootstrap.bundle.min.js.map, bootstrap.min.css and bootstrap.min.css.map).

The program does not interact with other softwares. It generates no Internet or network traffic. It neither saves any data to the computer or anywhere else. All the data that the user typed in (or the program generated) gets lost when the browser is closed or the page is refreshed (by pushing “F5” button or clicking on “Refresh” at the left bottom corner).

COPYRIGHT

This program was developed by DR. VAJDA, Péter, who is a police captain and liaison officer of the Europol Liaison Bureau of Hungary, but the tool was created fully independently from this official status and position. It was developed as a free-time activity on his own initiative.

Although the idea of utilizing the capabilities of such a tool initially intended solely personal purposes, after recognising the possible benefits for other colleagues within the law enforcement community – although reserving the rights provided by copyright law - law enforcement officers are authorised to use freely this program. However feedback is appreciated from the concerned law enforcement agencies regarding the usage of SIENA Constructor.

As most of the content that is generated by the program, and also the used components are universal, the tool is not nation-specific and might be widely used when English is the language of correspondence. However, the concrete national peculiarities might arouse the need for creating country-specific versions of this software. Taking the possibly high variety of different versions into consideration, the capacity of creating national specifications is very limited.

Though it is hardly thinkable that SIENA Constructor may cause any adverse impact, please take note that the developer does not take any responsibility for any damage, harm, malfunction, data loss or any other anomaly that is caused by the usage of the tool.

You can get in touch with the developer via vajpet@gmail.com. Feedbacks are highly appreciated.
